

Development Team Hiring: Coding Assignment

Position : Front End Developer

Programming assignment

You need to make an AngularJS/ReactJS app which mimics the Android app 4Pics 1Word. ([Play store link](#))

You should focus on the following features for the app:

1. Layout
2. Letter select and unselect behaviour
3. Hints (limit to only 3 hints)
4. Going to next level if the user answers correctly
5. Adding more levels should be possible by adding a few lines of code (optional).

You may apply the following constraints to your app :

1. There will be 3-4 stages only without any difference in difficulty level.
2. Images and answers are predefined.

Let us know when you are done. You should have basic knowledge of version control systems like git and should be able to pull and push code to a remote repository. Please provide access to the code repo on GitHub or BitBucket.

In addition, if you are able to host this app online for a demo that would get you some extra points.

If you are confused or stuck, feel free to reach out to us.
